How we measure performance

The numbers we used and the 10 questions we asked

What we compared

Year 1: June 2024–May 2025. **Year 2:** June 2025–May 2026. June 2026 is shown separately so both years have 12 months. We used the order date because the file shows a delivery date even for all 49,861 orders that were never delivered.

Metric definitions

Delivered revenue: We added Total_Amount once for each order marked Delivered. This amount includes shipping and subtracts coupons. Currency is unspecified; m means million source units.

Delivered orders and units: We counted each delivered order once and added the quantities on those orders. **AOV** = delivered revenue ÷ delivered orders.

Share of the total: We divided each group's delivered revenue or orders by the matching company total. To measure yearly change, we divided the difference by the Year 1 figure.

Order quality: We counted cancelled and returned orders separately. For each rate, we divided by all orders in the same period and group.

Repeat buyers: We counted anyone with at least two delivered orders in the same year, across any category. We divided their delivered revenue by total delivered revenue to get their share.

What we wanted to find out

01 How did delivered revenue, orders, units and average order value change between comparable years?

02 How much of the revenue movement came from order volume versus average order value?

03 Which months were strongest and weakest, and do comparable months tell the same story?

04 Which categories drive revenue, and which contribute more orders than revenue?

05 Which categories added or lost the most revenue in total?

06 Which brands and products explain the largest category movements?

07 How do city leaders and the metro group compare with other cities?

08 How much revenue comes from repeat buyers versus one-time buyers within each year?

09 How concentrated are revenue and orders by customer tier?

10 Which categories or customer tiers have higher cancellation and return rates?

How we put it together

01 Orders → 02 Add details → 03 Compare

We linked products and buyers to each order.

More orders. Barely more revenue.

Year 2 vs Year 1 | What changed by category, city and customer group

Metric	Year 1	Year 2	Change
Delivered revenue	**2,273.84m**	**2,277.78m**	**+0.17%**
Delivered orders	95,880	96,298	+0.44%
Delivered units	119,721	120,232	+0.43%
Average order value	23,715.49	23,653.48	−0.26%
Cancel rate (count)	5.11% (6,135)	4.88% (5,851)	−0.23 pp
Return rate (count)	5.04% (6,061)	4.93% (5,910)	−0.12 pp

What we found

01 Electronics brought in **72.43%** of Year 2 revenue from **26.59%** of delivered orders. Grocery brought in 0.72% from 13.46% of orders.

02 Madurai brought in the most of any city: **67.74m** (2.97%). Other cities made up 82.08% of Year 2 revenue. Metro revenue rose 0.53%, compared with 0.10% in other cities.

03 March 2026 was our strongest month at **199.06m**. February 2025 was the lowest at 172.13m. The following February was 6.11% higher.

04 Repeat buyers generated **90.98%** of Year 2 revenue. Platinum contributed 93.96%. Silver had higher cancellation and return rates than Platinum.

Three deep dives

1 / Electronics decline

Electronics **−5.04m** → HP **−6.86m** → HP Laptop V10 **−3.50m** → Other cities **−2.33m**

The laptop accounted for 51% of HP's net revenue drop. Its orders in Other cities fell from 77 to 54.

2 / Home growth

Home **+5.76m** → Urban **+2.38m** → Urban sofa **+0.58m**

Urban accounted for 41.4% of Home's revenue growth. The sofa went from 44 to 56 delivered orders.

3 / Where repeat sales came from

Platinum **2,140.11m** → Platinum repeat buyers **1,964.80m** → Their Electronics purchases **1,484.32m**

Year 2 revenue shown above. Electronics purchases in this group fell 5.24m. We identify repeat buyers separately each year, so this does not measure whether the same customers stayed.

Electronics in Year 2

Share of delivered revenue	72.43%
Share of delivered orders	26.59%

What we would do next

Leadership summary | Three ideas to test before moving budget

THE DECISION

We recommend keeping the current budget steady for now. Delivered revenue rose only 0.17%. We would find out why Electronics fell before moving money between categories.

Why revenue rose only 0.17%

More delivered orders	→	Lower order value	→	Net revenue change
+9.91m		−5.97m		+3.94m

Main findings

01 Kartly delivered **418 more orders**, but the average value per delivered order fell from 23,715.49 to 23,653.48.

02 Home (+5.76m) and Sports (+2.36m) offset the Electronics decline (−5.04m). Within Electronics, boAt (−8.47m) and HP (−6.86m) were the largest declining brands.

03 Repeat buyers generated **2,072.24m** of Year 2 revenue; one-time buyers generated **205.55m**. Silver's cancellation and return rates were 7.13% and 7.10%.

Recommendations

01 **We would look into the HP and boAt declines first.** We would start with HP Laptop V10 in Other cities and check stock, listing views and how many viewers bought before moving budget.

02 **We suggest testing a small Home campaign.** We would compare it with a similar group that does not see the campaign. Before spending more, we would check extra delivered revenue, how much is left after variable costs, returns and campaign cost.

03 **We would look at why Silver customers cancel or return orders.** We would test one fix and compare both rates with a similar group that does not receive it.

What we still don't know

We grouped metros ourselves because the file does not give official city tiers. We do not have product subcategories or past customer tiers. Delivered revenue includes shipping, but without costs or campaign spending, we cannot say what made a profit.

How we would test a change

01	→	02	→	03
Find the issue		Test one change		Compare results
